C++ static code analysis

Unique rules to find Bugs, Vulnerabilities, Security Hotspots, and Code Smells in your C++ code

All rules 578 | Vulnerability 13 | Bug 111 | Security Hotspot 18 | Code Smell 436 | Quick Fix 68

Tags

Search by name...

"memset" should not be used to delete sensitive data
Vulnerability

POSIX functions should not be called with arguments that trigger buffer overflows
Vulnerability

XML parsers should not be vulnerable to XXE attacks
Vulnerability

Function-like macros should not be invoked without all of their arguments
Bug

The address of an automatic object should not be assigned to another object that may persist after the first object has ceased to exist
Bug

Assigning to an optional should directly target the optional
Bug

Result of the standard remove algorithms should not be ignored
Bug

"std::scoped_lock" should be created with constructor arguments
Bug

Objects should not be sliced
Bug

Immediately dangling references should not be created
Bug

"pthread_mutex_t" should be unlocked in the reverse order they were locked
Bug

"pthread_mutex_t" should be properly initialized and destroyed
Bug

"pthread_mutex_t" should not be consecutively locked or unlocked twice

There shall be at most one occurrence of the # or ## operators in a single macro definition

Analyze your code

Code Smell | Major | preprocessor misra-c++2008 misra-c2004 misra-c2012

Because the evaluation order of # and ## are not specified, the results of using them both in the same macro could be unpredictable. Therefore macros should contain at most once instance of either # or ##.

Noncompliant Code Example

```
#define NonCompliant(a, b)  # a ## b
int main() {
  std::cout << NonCompliant(Hello, World);
}
```

The result of this code is unspecified. It will either print "HelloWorld" or trigger a compilation error. If ## is evaluated first this will print HelloWorld. If # is evaluated first this will cause a compilation error telling that **"Hello"World** is not a valid preprocessor token.

Compliant Solution

```
#define Stringfy(a) #a
#define Compliant(a, b)  Stringfy(a##b)

int main(){
  std::cout << Compliant(Hello, World);
}
```

This example will always print "HelloWorld".

Bug

"std::move" and "std::forward" should not be confused

Bug

A call to "wait()" on a "std::condition_variable" should have a condition

Bug

A pointer to a virtual base class shall only be cast to a pointer to a derived class by means of dynamic_cast

Bug

Functions with "noreturn" attribute should not return

Bug

RAII objects should not be temporary

Bug

"memcmp" should only be called with pointers to trivially copyable types with no padding

Bug

"memcpy", "memmove", and "memset" should only be called with pointers to trivially copyable types

Bug

"std::auto_ptr" should not be used

Bug

Destructors should be "noexcept"
