## C static code analysis

Unique rules to find Bugs, Vulnerabilities, Security Hotspots, and Code Smells in your C code

All rules 311

Vulnerability 13

Bug 74

Security Hotspot 18

Code Smell 206

Quick Fix 14

Tags

Search by name...

"memset" should not be used to delete sensitive data

Vulnerability

POSIX functions should not be called with arguments that trigger buffer overflows

Vulnerability

XML parsers should not be vulnerable to XXE attacks

Vulnerability

Function-like macros should not be invoked without all of their arguments

Bug

The address of an automatic object should not be assigned to another object that may persist after the first object has ceased to exist

Bug

"pthread\_mutex\_t" should be unlocked in the reverse order they were locked

Bug

"pthread\_mutex\_t" should be properly initialized and destroyed

Bug

"pthread\_mutex\_t" should not be consecutively locked or unlocked twice

Bug

Functions with "noreturn" attribute should not return

Bug

"memcpy" should only be called with pointers to trivially copyable types with no padding

Bug

### Functions should not have too many parameters

Analyze your code

Code Smell Major brain-overload

A long parameter list can indicate that a new structure should be created to wrap the numerous parameters or that the function is doing too many things.

#### Noncompliant Code Example

With a maximum number of 4 parameters:

```
void doSomething(int param1, int param2, int param3, int param4)
{
    ...
}
```

#### Compliant Solution

```
void doSomething(int param1, int param2, int param3, int param4)
{
    ...
}
```

#### See

- [C++ Core Guidelines I.23](#): Keep the number of function arguments low

Stack allocated memory and non-owned memory should not be freed

 Bug

Closed resources should not be accessed

 Bug

Dynamically allocated memory should be released

 Bug

Freed memory should not be used
