 Quick Fix 68

Tags

Search by name...

"memset" should not be used to delete sensitive data

 Vulnerability

POSIX functions should not be called with arguments that trigger buffer overflows

 Vulnerability

XML parsers should not be vulnerable to XXE attacks

 Vulnerability

Function-like macros should not be invoked without all of their arguments

 Bug

The address of an automatic object should not be assigned to another object that may persist after the first object has ceased to exist

 Bug

Assigning to an optional should directly target the optional

 Bug

Result of the standard remove algorithms should not be ignored

 Bug

"std::scoped\_lock" should be created with constructor arguments

 Bug

Objects should not be sliced

 Bug

Immediately dangling references should not be created

 Bug

"pthread\_mutex\_t" should be unlocked in the reverse order they were locked

 Bug

"pthread\_mutex\_t" should be properly initialized and destroyed

 Bug

"pthread\_mutex\_t" should not be consecutively locked or unlocked twice

Virtual functions should be declared with the "virtual" keyword

Analyze your code

 Code Smell  Major  Quick Fix  based-on-misra

For code compliant with C++98 or C++03 standards, declaring overriding virtual functions with the `virtual` keyword removes the need to check the base class to determine whether a function is virtual.

### Noncompliant Code Example

```
class Base
{
    virtual void f();
};
class Derived : public Base
{
    void f(); // Noncompliant, implicitly declared "virtual"
};
```

### Compliant Solution

```
class Base
{
    virtual void f();
};
class Derived : public Base
{
    virtual void f(); // Compliant, explicitly declared "virtual"
};
```

### See

- MISRA C++:2008, 10-3-2 - Each overriding virtual function shall be declared with the virtual keyword.

### See Also

- This rule will only trigger with code compliant with C++98 and C++03. For code compliant with C++11 and above see {rule:cpp:S3471}
