## C static code analysis

Unique rules to find Bugs, Vulnerabilities, Security Hotspots, and Code Smells in your C code

All rules **311**

Vulnerability **13**

Bug **74**

Security Hotspot **18**

Code Smell **206**

Quick Fix **14**

Tags

Search by name...

"memset" should not be used to delete sensitive data

Vulnerability

POSIX functions should not be called with arguments that trigger buffer overflows

Vulnerability

XML parsers should not be vulnerable to XXE attacks

Vulnerability

Function-like macros should not be invoked without all of their arguments

Bug

The address of an automatic object should not be assigned to another object that may persist after the first object has ceased to exist

Bug

"pthread\_mutex\_t" should be unlocked in the reverse order they were locked

Bug

"pthread\_mutex\_t" should be properly initialized and destroyed

Bug

"pthread\_mutex\_t" should not be consecutively locked or unlocked twice

Bug

Functions with "noreturn" attribute should not return

Bug

"memcpy" should only be called with pointers to trivially copyable types with no padding

Bug

### Line-splicing should not be used in "//" comments

Analyze your code

Bug Critical based-on-misra

Line-splicing occurs when the \ character is immediately followed by a new-line character. If the source line containing a // comment ends with a \, the next line becomes part of the comment. This may result in unintentional removal of code.

#### Noncompliant Code Example

```
void f ( void )
{
    int x = 0; // comment \
    if (x)
    {
        ++x; /* This is always executed */
    }
}
```

#### See

- MISRA C:2012, 3.2 - Line-splicing shall not be used in // comments
