C++ static code analysis

Unique rules to find Bugs, Vulnerabilities, Security Hotspots, and Code Smells in your C++ code

⊗ Code O Quick 68 Fix ΑII 578 Security 18 436 6 Vulnerability (13) **R** Bug (111) rules Hotspot Smell

Tags

"memset" should not be used to delete sensitive data 6 Vulnerability POSIX functions should not be called with arguments that trigger buffer overflows ♠ Vulnerability XML parsers should not be vulnerable to XXE attacks Vulnerability Function-like macros should not be invoked without all of their arguments ₩ Bug The address of an automatic object should not be assigned to another object that may persist after the first object has ceased to exist 👬 Bug Assigning to an optional should directly target the optional # Bug Result of the standard remove algorithms should not be ignored 👬 Bug "std::scoped_lock" should be created with constructor arguments # Bug Objects should not be sliced # Bug Immediately dangling references should not be created

A pointer to a virtual base class shall only be cast to a pointer to a derived class by means of dynamic_cast

Analyze your code

Search by name.

Casting from a virtual base to a derived class, using any means other than dynamic_cast has undefined behaviour. The behaviour for dynamic_cast is defined.

misra-c++2008

Note: As of C++17, the program is considered as ill-formed and an error is reported.

Most compilers emit an error for previous versions of C++ as well.

Noncompliant Code Example

Rug Blocker 🕝

```
class B { ... };
class D: public virtual B { ... };
D d:
B *pB = &d;
D *pD1 = ( D * ) pB; // Noncompliant - undefined behaviour
D *pD2 = static_cast<D*>(pB); // Noncompliant - undefined beh
```

Compliant Solution

```
class B { ... };
class D: public virtual B { ... };
D d;
B *pB = &d;
D *pD1 = dynamic cast<D*>(pB); // Compliant, but pD2 may be N
D & D2 = dynamic_cast<D&>(*pB); // Compliant, but may throw a
```
